Permutation Group

Lecture Index:-i) Construction of S_n

ii) Properties of S_n

iii) Even/odd permutation

Symmetric Set/Permutation Set -:Set of all one-one onto mapping from set containing n elements to itself. It's denoted by S_n. The number of elements in S_n is n! $[o(S_n) = n!]$

Properties of S_n

Cyclic/cycles Permutation-: Let S be a finite set. Let $a \in S$ and σ be a permutation on S.

Length of cycle-: An element $\sigma \in S_n$ is called cycle of length r if there exist r symbols such that $(i_1, i_2, i_3, \ldots i_r)$.

If length of cycle is r then it is called r - cycle

Disjoint cycle-:let$c_1 = (a_1, a_2, a_3, \ldots a_r)$ and $c_2 = (b_1, b_2, b_3, \ldots b_s)$ be tw cycles, c_1, c_2 are called disjoint if there is no common symbol in thes two cycles i.e., $(a_1, a_2, a_3, \ldots a_r) \cap (b_1, b_2, b_3, \ldots b_s) = \phi$

Transposition-: Every cycle of length 2 is a transposition.

Note-: i) every permutation $\sigma \in S_n$ can be expressed as a product of disjoint cycles.

ii) Every r-cycle can be expressed as a product of (r-1) transposition.

Product of permutation-: let $\sigma_1 \in S_n$ &$\sigma_2 \in S_n$ be two permutation of S_n, then product of permutation is $\sigma_1\sigma_2 \in S_n$.

Even & Odd permutation

The number of transposition in decomposition of any permutation σ is either always odd or always even according to σ is odd or even permutation.

Odd permutation-: If $\sigma \in S_n$ be r-cycle, then σ is odd permutation if r is even or σ has odd transposition.

Even permutation-: If $\sigma \in S_n$ be r-cycle, then σ is even permutation if r is odd or σ has even transposition.

NOTE-: The permutation groups S_n exactly half are even and half are odd.

Alternating group,(A_n)-: The set of all even permutation of $S_n$forms w.r.t composition of mappings. It's denoted by A_n and called alternating group of even permutation.

Order of alternating group, $A_n$is $\frac{n!}{2}$.
